1. PROBLEM STATEMENT

The insurance company manages Vehicle, Property and Life insurance through processes that can become slow and difficult to control when policy information, quotations and claims are handled separately. The proposed Salesforce solution brings these activities into one platform so policy and claim information can be maintained together.

- Standardize policy quoting and issuance.
- Capture product-specific information in a common data model.
- Automate claim creation, routing and approval.
- Provide role-based access to agents, adjusters and managers.

2. OBJECTIVES

- Create a flexible Policy and Claim data model for Vehicle, Property and Life insurance.
- Use Record Types and Field Sets for product-specific information.
- Build a guided Auto Quoting Screen Flow.
- Calculate premiums through Apex.
- Route claims according to policy type.
- Provide an LWC Claims Dashboard.
- Implement approval processing for high-value claims.
- Apply Sharing Rules and Permission Sets.
- Test automation and Apex before completion.

3. CHALLENGES

- Managing different fields for three insurance products.
- Routing claims according to the related policy type.
- Connecting Salesforce Flows with Apex logic.
- Building a useful adjuster dashboard.
- Maintaining security while supporting daily work.

4. SOLUTION APPROACH

The project uses Salesforce as a centralized platform. Policy and Claim are custom objects, Record Types separate insurance products, Screen Flow supports guided quotation, Apex handles premium calculation and claim retrieval, and Record-Triggered Flows automate routing and updates. LWC provides the adjuster dashboard, while Approval Processes, Sharing Rules and Permission Sets support processing and security.

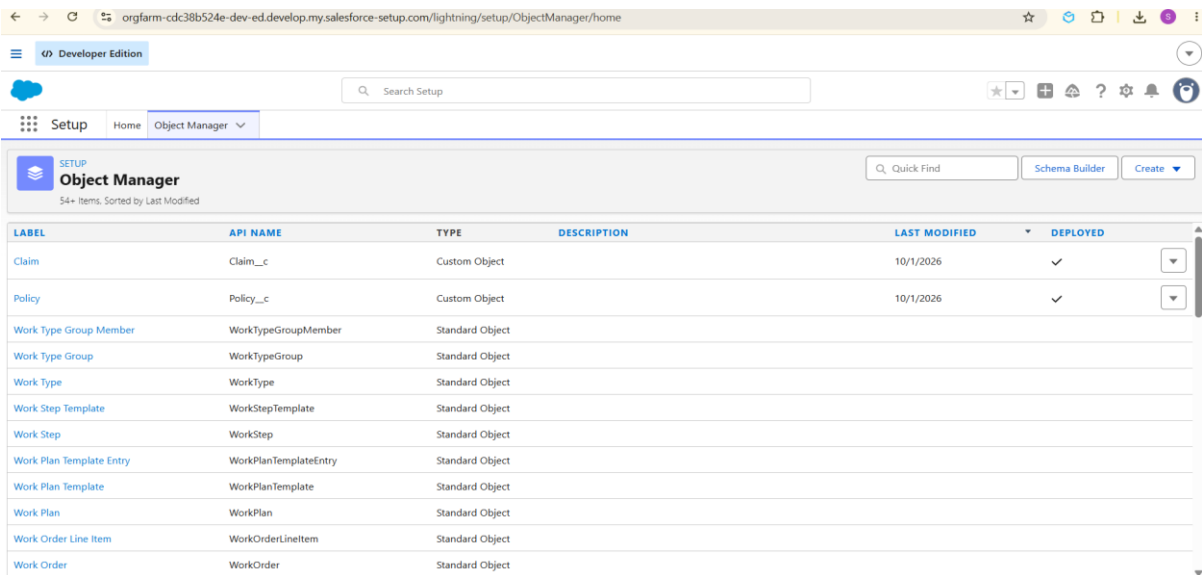

5. MILESTONES

Milestone 1: Core Data Model & Policy Configuration

User Story 1: Creation of Custom Objects

Create the Policy custom object with Policy Number as an Auto Number record name, format P-{0000}, starting number 1. Enable reports, activities and field history, deploy the object and allow search.

Create the Claim custom object with Claim Number as an Auto Number record name, format C-{0000}, starting number 1. Enable reports, activities and field history, deploy the object and allow search.

Object Manager

5. Create Fields in the Claim Object

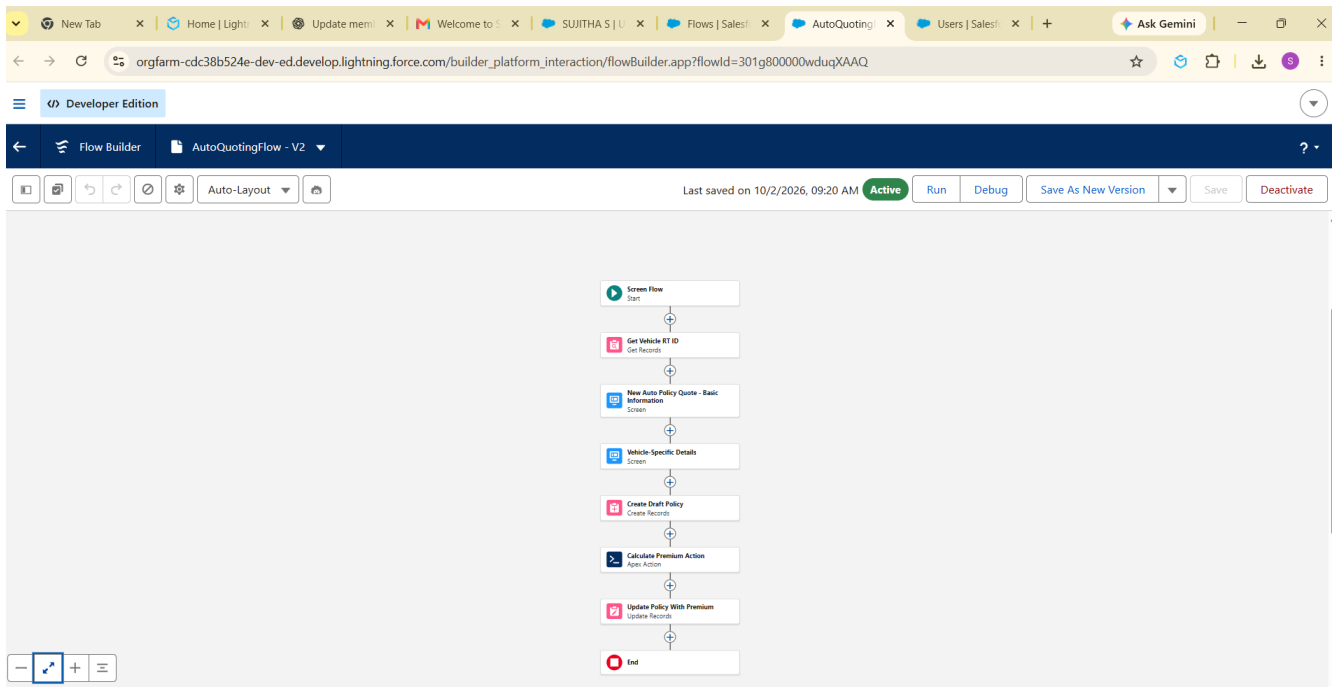

S.No	Field	Data Type
1	Adjuster	Lookup(User)
2	Approval Status	Picklist: New, Submitted for Approval, Approved, Rejected
3	Claim Amount	Currency(16,2)
4	Date of Loss	Date/Time
5	Description	Long Text Area
6	Policy	Lookup(Policy)

The screenshot shows the Salesforce Setup interface. The left sidebar contains a navigation menu with options like Details, Fields & Relationships (selected), Page Layouts, Lightning Record Pages, Buttons, Links, and Actions, Compact Layouts, Field Sets, Object Limits, Record Types, Related Lookup Filters, Search Layouts, List View Button Layout, Restriction Rules, and Sharing Rules. The main content area is titled 'Claim' and shows the 'Fields & Relationships' section with 12 items, sorted by Field Label. The table below lists the fields:

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Adjuster	Adjuster__c	Lookup(User)		✓
Approval Status	Approval_Status__c	Picklist		
Claim Amount	Claim_Amount__c	Currency(16, 2)		
Claim Number	Name	Auto Number		✓
Created By	CreatedById	Lookup(User)		
Date of Loss	Date_of_Loss__c	Date/Time		
Description	Description__c	Long Text Area(32768)		
Last Modified By	LastModifiedById	Lookup(User)		
Owner	OwnerId	Lookup(User,Group)		✓

6. Create an AutoQuoting Screen Flow

1. Create AutoQuotingFlow as a Screen Flow.
2. Retrieve the Auto Policy Record Type.
3. Create a basic information screen for customer, policy start date and state.
4. Create a vehicle-specific screen for VIN and Model Year.
5. Create a draft Policy record.
6. Store the created Policy Id in a variable.
7. Save and activate the flow.

7. Create Validation Rule on Policy Object

Create VIN_Must_Be_17_Characters for Auto policies. The rule checks that VIN contains exactly 17 characters and displays an error on the VIN field.

General Options

Required	☐
Unique	☐
Case Sensitive	☐
External ID	☐

Milestone 2: Complex Policy Issuance & Claim Routing Automation

1. Create an Apex Class (PremiumCalculator)

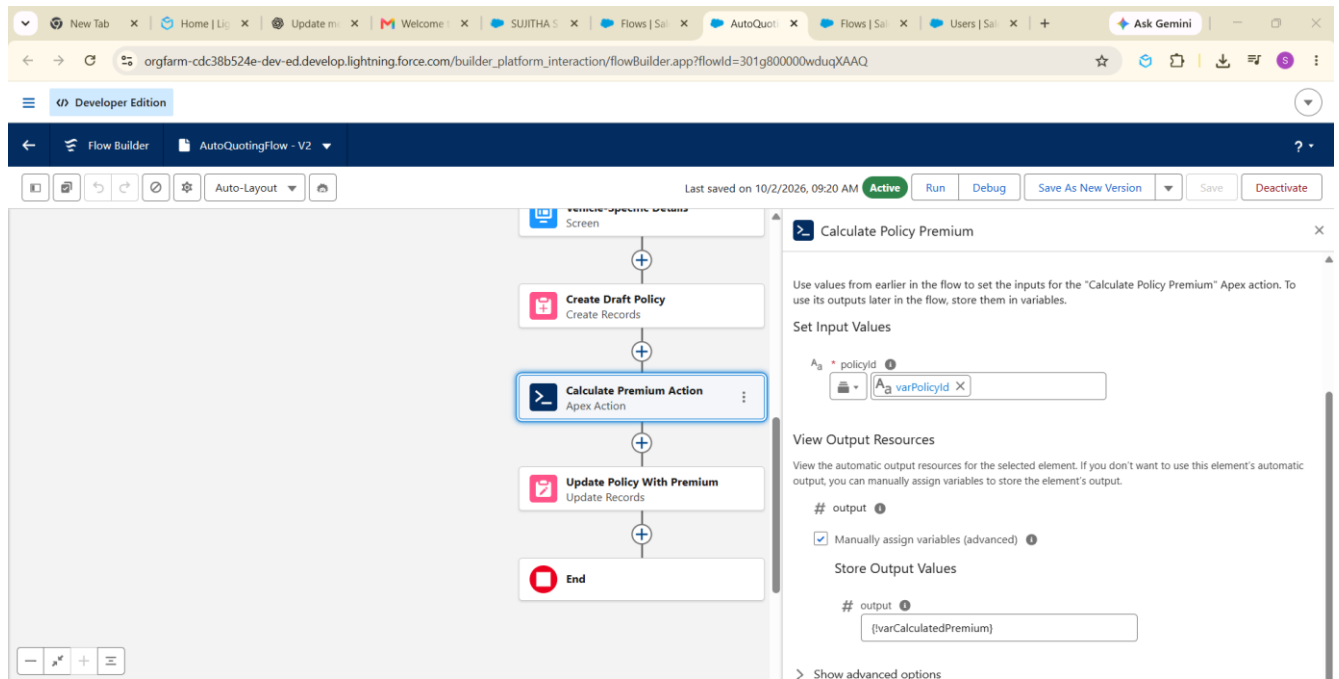

Create PremiumCalculator with an invocable method that receives a Policy Id, reads policy information and returns a calculated premium using the configured rating logic.

```
1 public class PremiumCalculator {
2     public class PremiumInputWrapper {
3         @InvocableVariable(required=true)
4         public Id policyId;
5     }
6
7     @InvocableMethod(label='Calculate Policy Premium' description='Calculates premium based on policy fields (VIN, Model Year, State).')
8     public static List<Decimal> calculatePremium(List<PremiumInputWrapper> inputs) {
9
10        List<Decimal> premiumResults = new List<Decimal>();
11        Set<Id> policyIds = new Set<Id>();
12
13        for (PremiumInputWrapper input : inputs) {
14            if (input.policyId != null) {
15                policyIds.add(input.policyId);
16            }
17        }
18
19        List<Policy__c> policiesToRate = [
20            SELECT Id, VIN__c, Model Year__c, Policy State__c
21            FROM Policy__c
22            WHERE Id IN :policyIds
23        ];
24
25        for (Policy__c policy : policiesToRate) {
26            // Calculate premium logic
27        }
28
29        return premiumResults;
30    }
31}
```

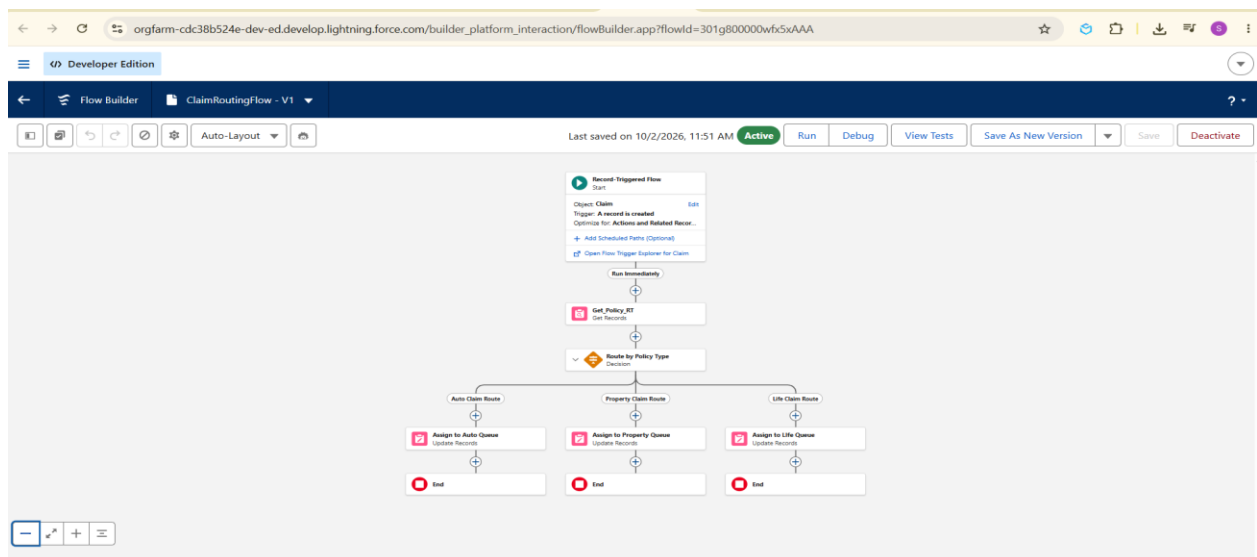

2. Integrate this Apex action into AutoQuotingFlow

8. Add Calculate Premium Action after draft Policy creation.
9. Pass the Policy Id variable.
10. Store the returned premium in a currency variable.
11. Update the draft Policy Premium field.
12. Save a new version and activate.

3. Create a Record-Triggered Flow (After Save) on Claim

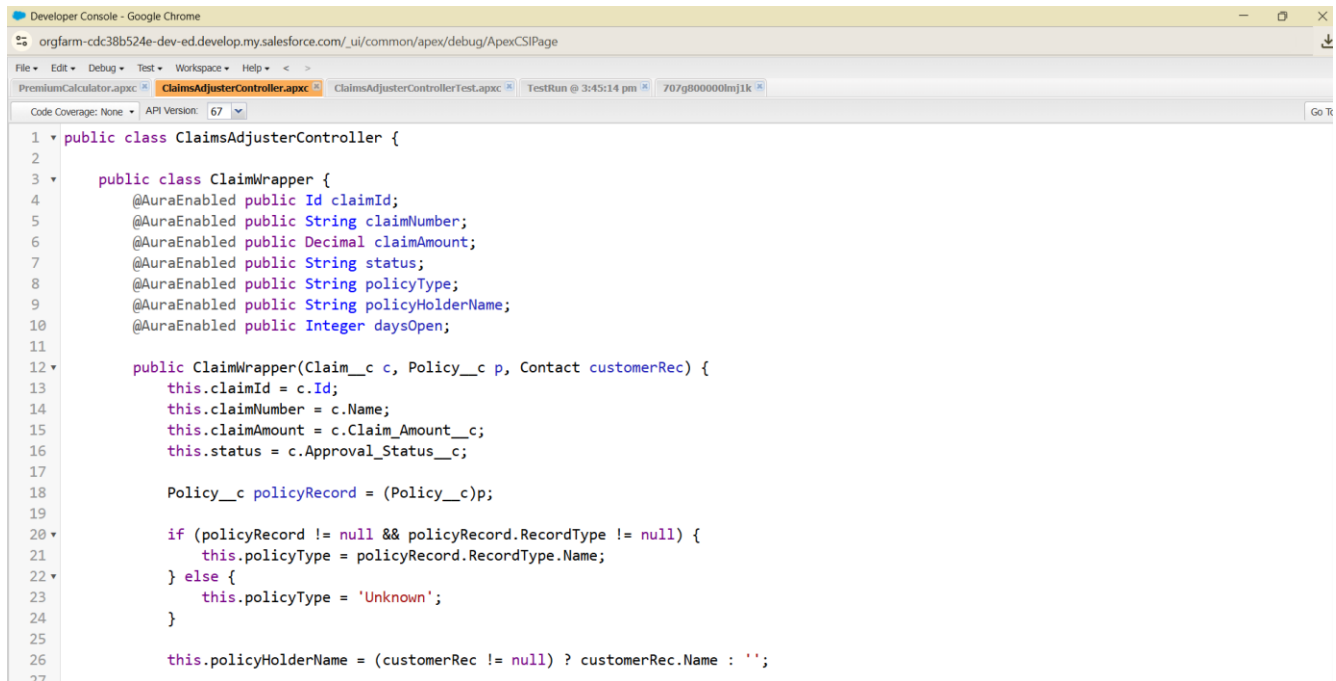

13. Create the flow on Claim.
14. Retrieve the related Policy.
15. Identify the Policy Record Type.
16. Use a Decision element for Auto, Property and Life.
17. Assign Auto claims to Auto queue.
18. Assign Property claims to Property queue.
19. Assign Life claims to Life queue.
20. Save and activate.

Milestone 3: Claims Adjuster LWC Dashboard Development

1. Create a robust Apex class (ClaimsAdjusterController)

Create ClaimsAdjusterController to query claims owned by the logged-in user and return claim number, amount, status, policy type, policy holder and days open through a wrapper class.

```
1 public class ClaimsAdjusterController {
2
3     public class ClaimWrapper {
4         @AuraEnabled public Id claimId;
5         @AuraEnabled public String claimNumber;
6         @AuraEnabled public Decimal claimAmount;
7         @AuraEnabled public String status;
8         @AuraEnabled public String policyType;
9         @AuraEnabled public String policyHolderName;
10        @AuraEnabled public Integer daysOpen;
11
12        public ClaimWrapper(Claim__c c, Policy__c p, Contact customerRec) {
13            this.claimId = c.Id;
14            this.claimNumber = c.Name;
15            this.claimAmount = c.Claim_Amount__c;
16            this.status = c.Approval_Status__c;
17
18            Policy__c policyRecord = (Policy__c)p;
19
20            if (policyRecord != null && policyRecord.RecordType != null) {
21                this.policyType = policyRecord.RecordType.Name;
22            } else {
23                this.policyType = 'Unknown';
24            }
25
26            this.policyHolderName = (customerRec != null) ? customerRec.Name : '';
27        }
28    }
29}
```

2. Create claimsDashboardLwc

- Create and expose the LWC.
- Call the Apex method using @wire.
- Display assigned claims.
- Provide All, Auto, Property and Life filtering.
- Show the number of visible assigned claims.

```
1 import { LightningElement, wire, track } from 'lwc';
2 // Import the Apex method
3 import getAssignedClaims from '@salesforce/apex/ClaimsAdjusterController.getAssignedClaims';
4
5
6 export default class ClaimsDashboardLwc extends LightningElement {
7   // List to hold all data retrieved from Apex
8   @track allClaims = [];
9   // List to display after filtering
10  @track visibleClaims = [];
11  error;
12
13  // Wire service to call the Apex method
14  @wire(getAssignedClaims)
15  wiredClaims({ error, data }) {
16    if (data) {
17      this.allClaims = data;
18      this.visibleClaims = data; // Initially display all claims
19      this.error = undefined;
20    } else if (error) {
21      this.error = error;
22      this.allClaims = undefined;
23      this.visibleClaims = undefined;
24      console.error('Error retrieving claims:', JSON.stringify(error));
25    }
26  }
27
28  // Client-side filtering logic (Required by M3)
29  handleFilterChange(event) {
30    const selectedPolicyType = event.target.value;
31
32    if (selectedPolicyType === 'All') {
33      this.visibleClaims = this.allClaims;
34    } else {
35      // Filter claims where policyType matches the selected value
36    }
37  }
38}
```

3. Create a reusable component (claimTileLwc)

Create a child component to display each claim's number, policy type, policy holder, amount, status and days open. The component can show a suitable icon based on policy type.

Milestone 4: Advanced Claim Processing, Security & Code Setup

1. Modify the Claim object to include an Approval Status field

Create a picklist with New, Submitted for Approval, Approved and Rejected

The screenshot shows the Salesforce Setup interface for the 'Claim' object. The 'Fields & Relationships' section is active, displaying a list of 12 items sorted by field label. The table below lists the fields:

FIELD LABEL	FIELD NAME	DATA TYPE	CONTROLLING FIELD	INDEXED
Adjuster	Adjuster__c	Lookup(User)		✓
Approval Status	Approval_Status__c	Picklist		
Claim Amount	Claim_Amount__c	Currency(16, 2)		
Claim Number	Name	Auto Number		✓
Created By	CreatedById	Lookup(User)		
Date of Loss	Date_of_Loss__c	Date/Time		

2. Configure the Approval Process

21. Create High Value Claim Approval.
22. Set entry criteria to Claim Amount greater than 50,000.
23. Allow the Claim owner to submit.
24. Step 1: Senior Adjuster.
25. Step 2: Department Manager.
26. Set status to Submitted for Approval on submission.
27. Set status to Approved after approval.
28. Set status to Rejected after rejection.
29. Activate the process.

The screenshot shows the Salesforce Setup interface for the 'Approval Processes' section. The 'Step2 Manager Review' is visible, showing the 'Final Approval Actions' and 'Final Rejection Actions'.

Final Approval Actions:

Action	Type	Description
Record Lock	Record Lock	Lock the record from being edited
Field Update	Field Update	Update Status Approved

Final Rejection Actions:

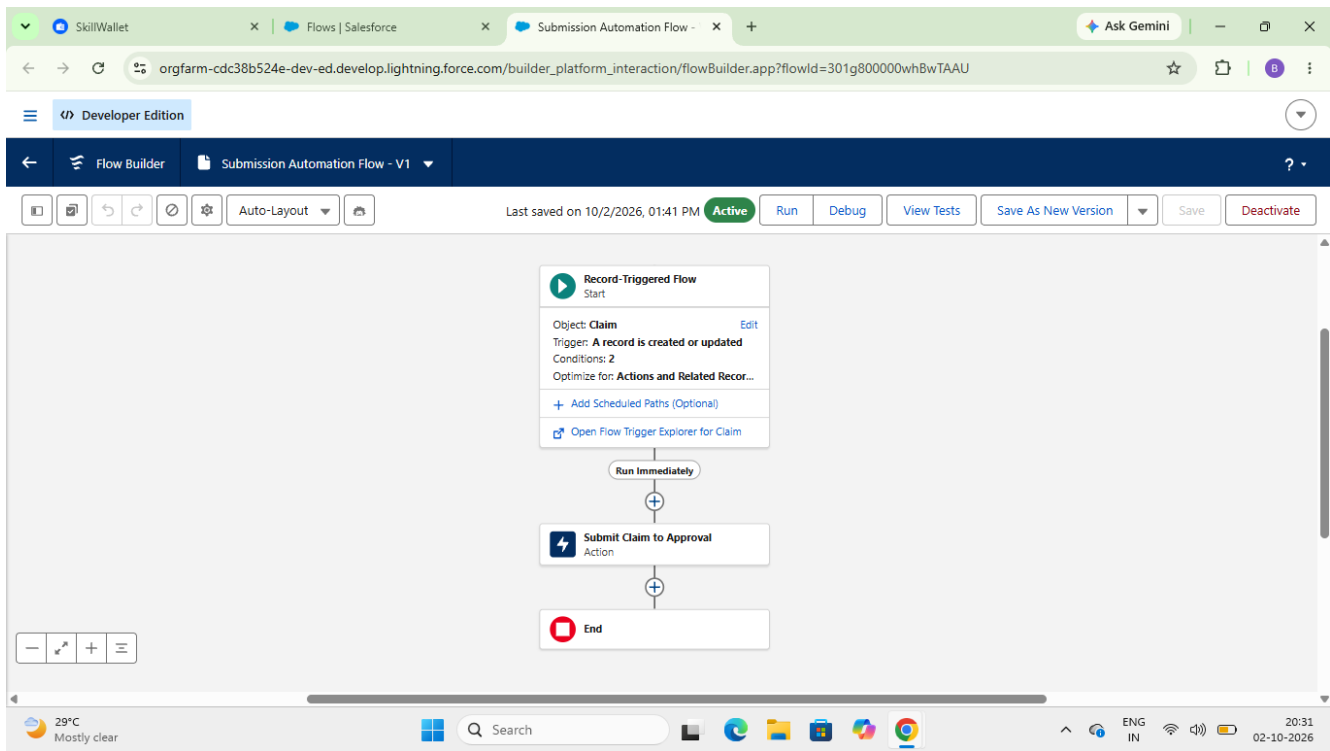

Action	Type	Description
Record Lock	Record Lock	Unlock the record for editing
Field Update	Field Update	Update Status Rejected

Recall Actions:

Action	Type	Description
Record Lock	Record Lock	Unlock the record for editing

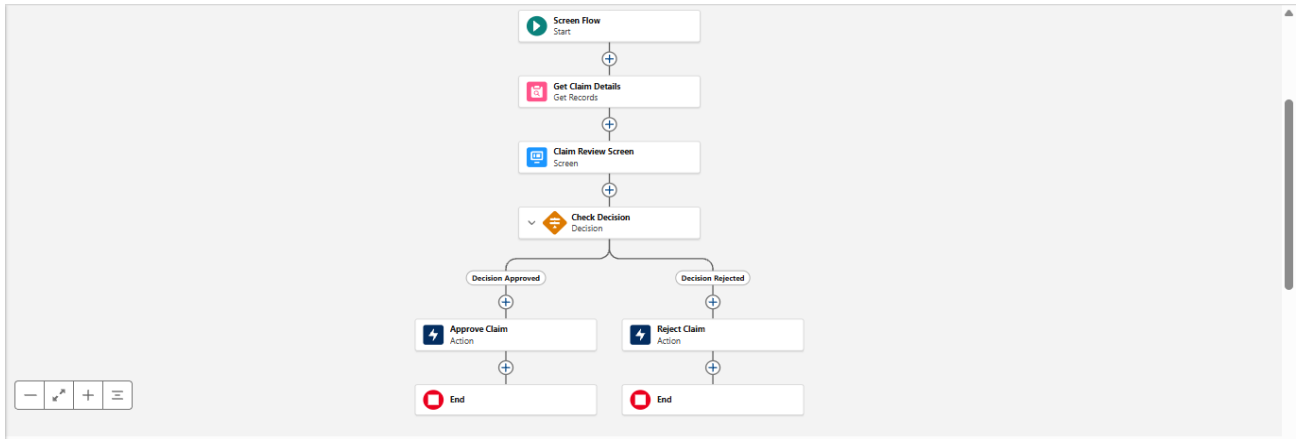

3. Create a Record-Triggered Flow for high-value claims

Create an After-Save Claim flow that checks Claim Amount > 50,000 and Approval Status = New, then submits the record to High Value Claim Approval.

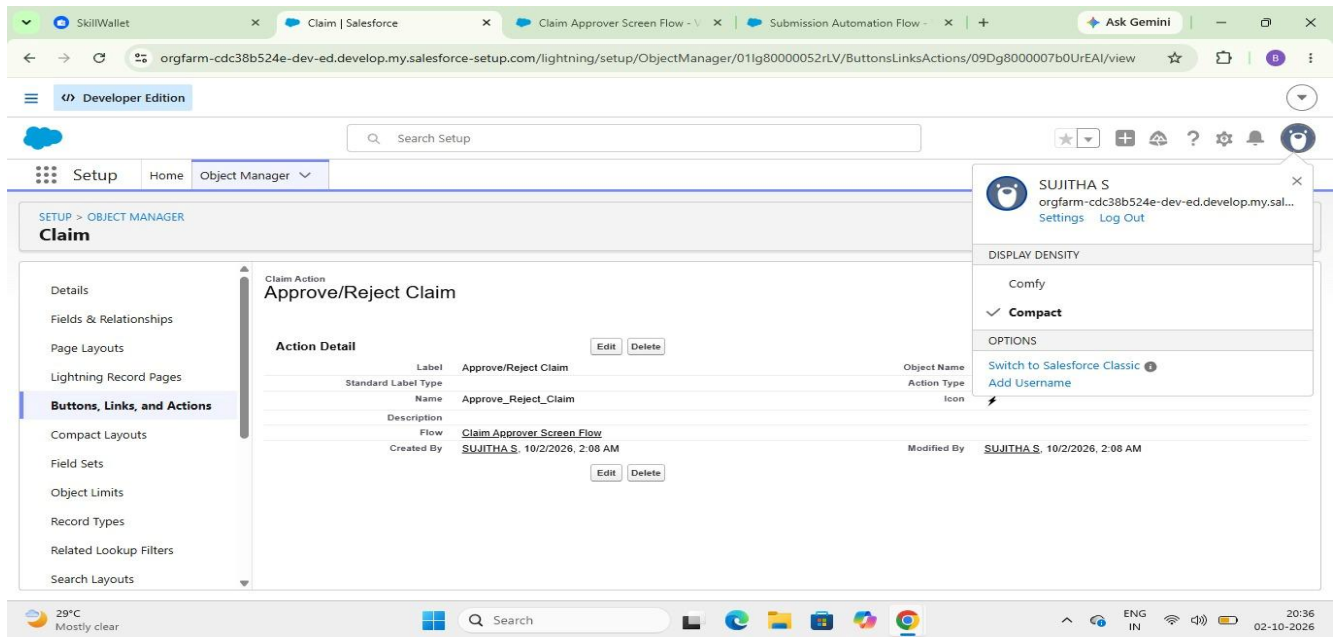

4. Implement a Screen Flow for approvers

30. Create an input variable named recordId.
31. Get Claim Details.
32. Display Claim ID, Amount and Policy Type.
33. Add Approve and Reject choices.
34. Capture approver comments.
35. Use a Decision element.
36. Submit the selected approval action.
37. Create Approve/Reject Claim Quick Action.
38. Add it to the Claim page layout.

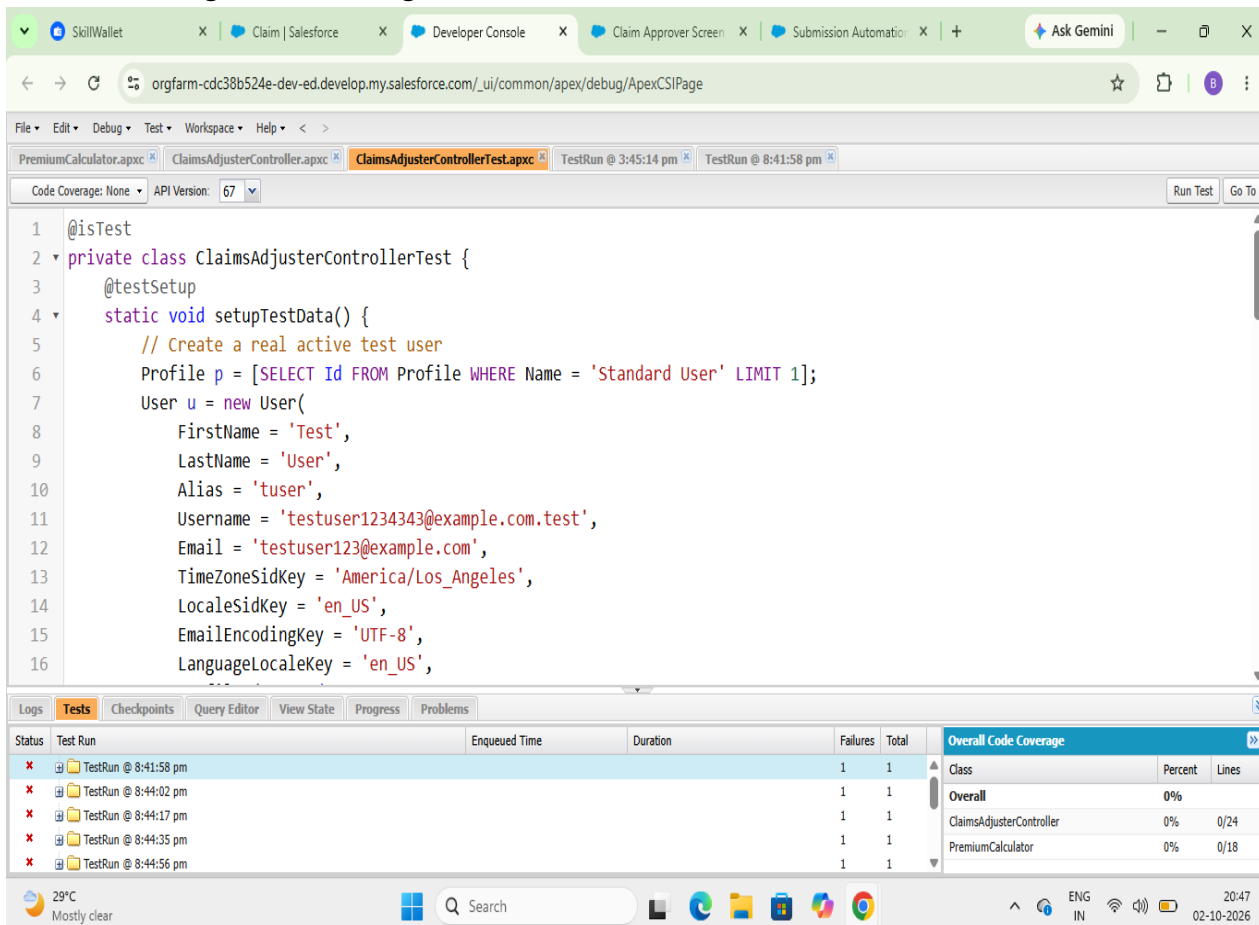

Buttons, Links, and Actions
9 Items, Sorted by Label

LABEL	NAME	DESCRIPTION	TYPE	CONTENT S	OPTIONS
Accept	Accept			Standard page	
Approve/Reject Claim	Approve_Reject_Claim		Flow	Flow	Switch to Salesforce Classic Add Username
Claim Tab	Tab			Standard page	
Clone	Clone			Standard page	
Delete	Delete			Standard page	
Edit	Edit			Standard page	

5. Write an Apex Test Class

Create ClaimsAdjusterControllerTest with test data for User, Contact, Policy and Claim. Run the controller method and verify returned values. The project target is 95% or higher coverage.

The screenshot shows the Salesforce Developer Console with the Apex code for `ClaimsAdjusterControllerTest`. The code is as follows:

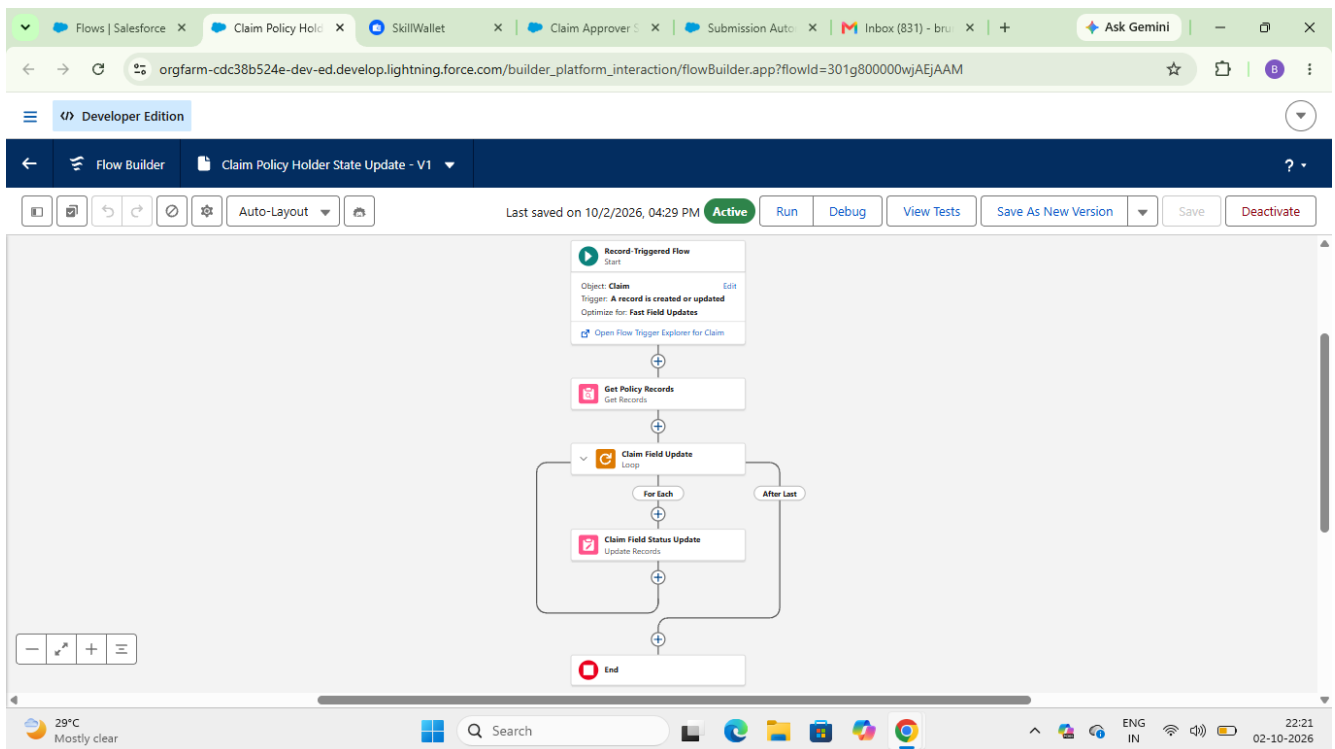

```
@isTest
private class ClaimsAdjusterControllerTest {
    @testSetup
    static void setupTestData() {
        // Create a real active test user
        Profile p = [SELECT Id FROM Profile WHERE Name = 'Standard User' LIMIT 1];
        User u = new User(
            FirstName = 'Test',
            LastName = 'User',
            Alias = 'tuser',
            Username = 'testuser123434@example.com.test',
            Email = 'testuser123@example.com',
            TimeZonesidKey = 'America/Los_Angeles',
            LocaleSidKey = 'en_US',
            EmailEncodingKey = 'UTF-8',
            LanguageLocaleKey = 'en_US',
        );
    }
}
```

Below the code, a log table is displayed with the following data:

User	Application	Operation	Time	Status	Read	Size

02-10-2026

The top screenshot shows the 'Sharing Settings' page in Salesforce Setup. The 'Claim Sharing Rules' table is visible with the following data:

Action	Criteria	Shared With	Access Level
Edit Del	Claim: Policy Account Holder State EQUALS CA	Role: CEO	Read/Write
Edit Del	Claim: Policy Account Holder State EQUALS TX	Role: CEO	Read/Write

The bottom screenshot shows the 'Profiles That Override Claim Sharing' table with the following data:

Profile	Custom Profile	Organization-Wide Permissions	View All Data	Modify All Data	View All Records	Modify All Records
Analytics Cloud Integration User	☐	☒	☒	☐	☒	☐
System Administrator	☐	☒	☒	☒	☒	☒

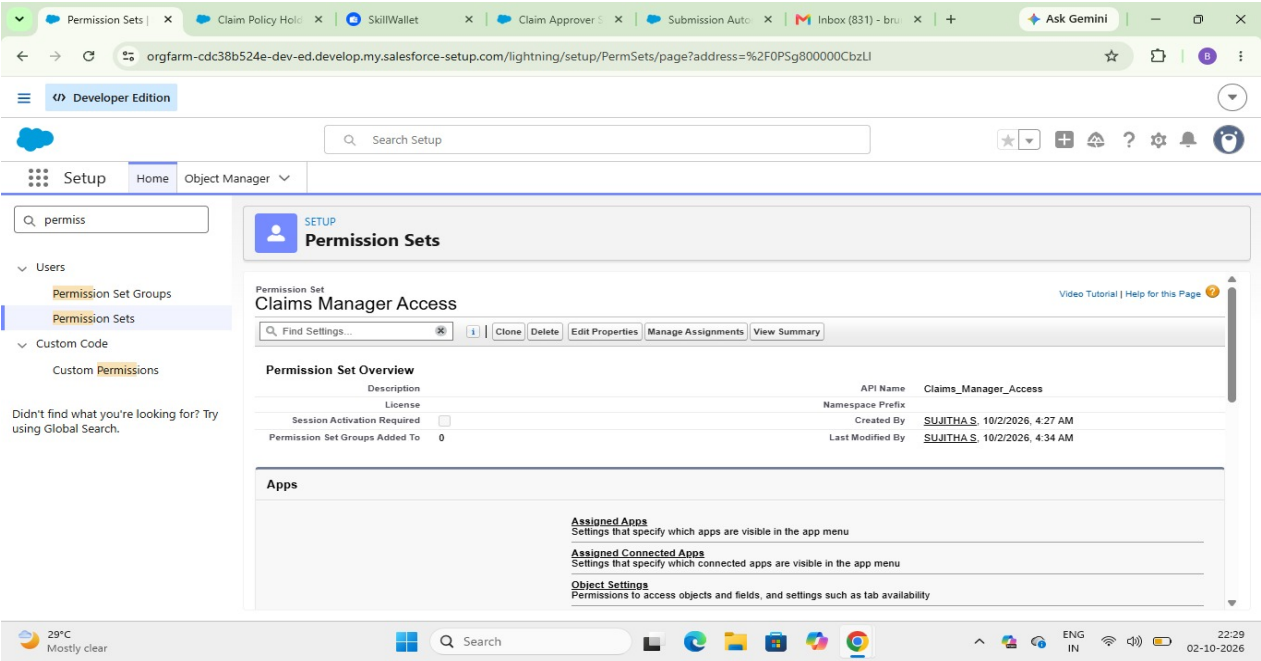

7. Finalize all Permission Sets

Role	Policy	Contact	Claim	Additional Access
Insurance Agent	Create, Read	Read, Edit	Read	Flow User; PremiumCalculator

Claims Manager	Read	Read, Edit	Read, Edit, Delete	Run Reports; Manage Approvals
Claims Adjuster	Read	—	Read, Edit	ClaimsAdjusterController

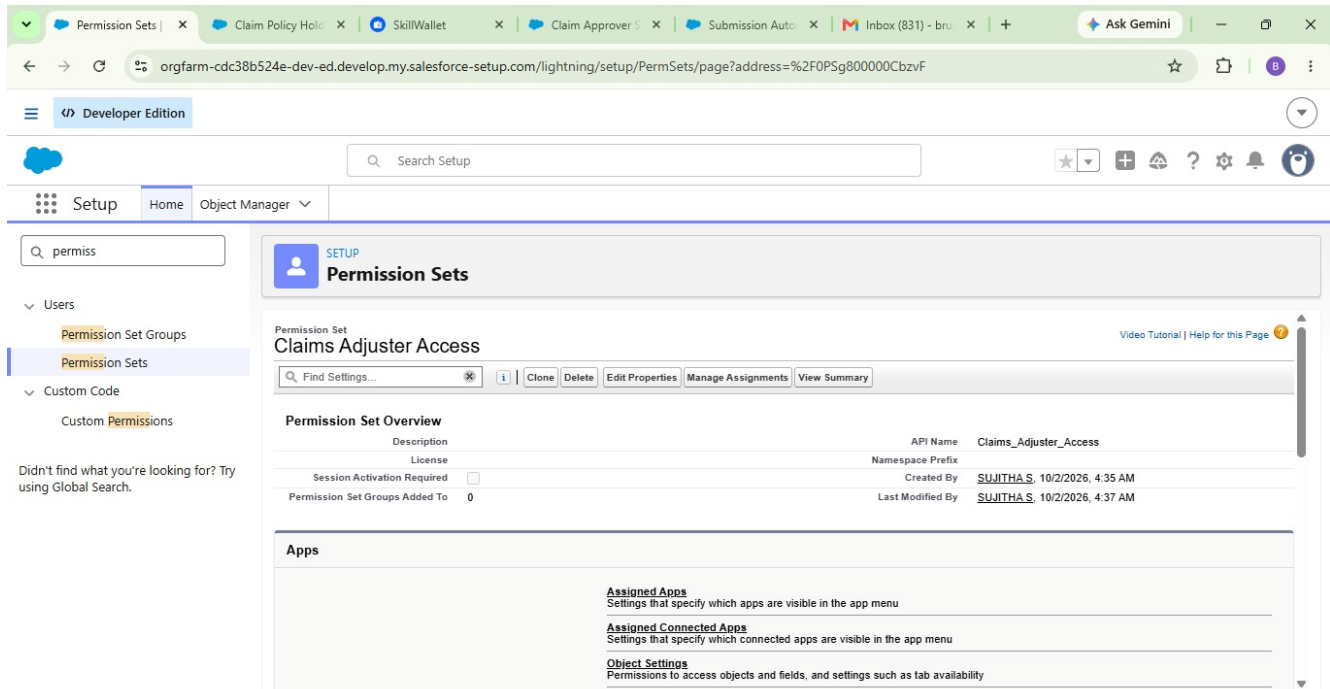

7.1 Create Claims Manager Access Permission Set

Provide the Claims Manager with reporting, approval and claim-management permiss

7.2 Create Claims Adjuster Access Permission Set

Provide Policy read access, Claim read/edit access and ClaimsAdjusterController Apex access.

6. FUNCTIONAL & PERFORMANCE TESTING

Testing should cover the complete implementation: data model, quotation flow, VIN validation, premium calculation, claim routing, dashboard, filtering, approval, sharing and permissions.

Test Area	Expected Result
Policy Record Types	Auto, Property and Life records can be created.
AutoQuotingFlow	Draft Policy is created from entered details.
VIN Validation	Invalid VIN length is rejected for Auto.
Premium Calculation	Premium is calculated and saved.
Claim Routing	Claims go to the correct queue.
LWC Dashboard	Assigned claims are displayed.
Dashboard Filter	All/Auto/Property/Life filtering works.
Approval	High-value claims enter approval stages.
Security	Role and sharing access works as configured.
Apex Test	Controller tests execute successfully.

7. ADVANTAGES & DISADVANTAGES

Advantages

- Centralized Vehicle, Property and Life insurance management.
- Guided quotation using Screen Flow.
- Automated premium calculation.
- Automatic claim routing.
- Structured high-value claim approval.
- Focused LWC dashboard.
- Validation improves data consistency.
- Flexible Record Types and Field Sets.
- Role/state-based access control.

Disadvantages

- Multiple Salesforce components require maintenance.
- Different products need different data and rules.
- Automation requires careful testing.
- Apex and LWC need technical skills.
- Configuration changes may affect dependent automation.

8. CONCLUSION

The Multi-Line Insurance Policy and Claims Management System brings policy and claim activities into one Salesforce solution. The milestone structure provides a clear implementation sequence: build the data model, add policy and claim automation, develop the adjuster dashboard, and complete approval, testing and security.

9. FUTURE SCOPE

- Extend quotation flows to Property and Life.
- Integrate external vehicle or property databases.
- Add advanced premium-rating rules.
- Add more dashboard metrics and reports.
- Add claim and approval notifications.
- Support additional insurance products.
- Improve automated testing and deployment.

10. APPENDIX

A. Main Salesforce Components

Component	Purpose
Policy__c	Stores policy information.
Claim__c	Stores claim information.
Record Types	Separate insurance products and claim types.

Field Sets	Group product-specific fields.
AutoQuotingFlow	Guided Auto quotation.
PremiumCalculator	Calculates premium.
ClaimsAdjusterController	Retrieves assigned claims.
claimsDashboardLwc	Displays and filters claims.
claimTileLwc	Displays individual claim details.
Approval Process	Handles high-value approvals.
Sharing Rules	Provide state-based access.
Permission Sets	Provide role-based access.

B. Team Implementation Checklist

Milestone	Completion Check
Milestone 1	Objects, fields, Record Types, Field Sets, AutoQuotingFlow and VIN validation.
Milestone 2	Premium calculation and claim routing.
Milestone 3	Apex controller and LWC dashboard components.
Milestone 4	Approval, approver flow, testing, sharing and Permission Sets.
Final	Functional testing and evidence/screenshots collected.
